

# BAY COUNTY MOSQUITO CONTROL

*Improve Quality of Life*

## Artificial Containers

Homeowners often unknowingly contribute to mosquito production by breeding mosquitoes in containers in their own backyards. Female mosquitoes lay eggs in standing water that collects in various backyard containers. After eggs hatch, the larvae live in these aquatic habitats until they emerge as biting adults about one week later.

*Bird bath breeding mosquitoes in Bay County. Rinse bird baths once a week to prevent mosquito breeding.*

Dumping water from containers eliminates mosquitoes and contributes to a mosquito-free environment. Help Bay County Mosquito Control by doing your part.
